

Legend & Usage Notes

Column	Description	Usage Tips
Pathogen Name	Accepted current name; obsolete/synonym noted where applicable.	Use for cross-referencing assay design.
Overview	1–2 line clinical summary.	Quick reference for triage and panel selection.
Taxonomy	Full hierarchical classification to genus level.	Useful for selecting genus-level vs. species-specific PCR targets.
Transmission	Primary routes of acquisition.	Informs infection control and specimen type selection.
Laboratory Detection Methods	Culture, microscopy, serology, and molecular methods.	Guide for algorithm development and method selection.
Research Challenges	Technical issues, resistance mechanisms, taxonomic updates.	Troubleshooting reference; update regularly with new literature.
Related PCR Targets	Gene targets used in diagnostic PCR/qPCR assays.	Link to internal assay database for cross-referencing.
Green column (PCR Targets)	Colour-coded for quick visual identification of molecular targets.	Filter or sort this column when building multiplex panels.
